

OSPF

Open Shortest Path First

It is Link State Routing Protocol

It contains 3 tables

- Neighbor table: Next Route info
- Link State Database: LSP
- Routing table: Best Route

metric:

Cost $\rightarrow$ Using interface bandwidth

$$\left[\frac{10^8}{\text{bandwidth in Kbps}} \right]$$

Router ID

Identification of OSPF Router

IP format: x.x.x.x

- manually assigned by admin
- Highest IP in Loopback Interface
- Highest IP in Physical Interface

Area ID:

Area $\rightarrow$ Group

weB

used cost bit $\rightarrow$ matching bit

0 - cost

1 - don't care

Procs: 10

Same / Different

neighborship:

By Sending Hello Packet

OSPF timer

Hello time = 10 Sec

Dead time: Hx4 = 40 Sec

neighborship condition
Same Network
Same Area
unique Router ID
Same time

$$\text{cost} = \frac{10^8}{\text{Bandwidth in bits}}$$

$$= \frac{10^8}{10,000 \times 1000}$$

$$= 10$$
